Scientists may be one step closer to recreating the woolly mammoth after they have successfully inserted 14 of the extinct animal's genes into the live DNA of an elephant

LONDON : Scientists may be one step closer to recreating the woolly mammoth after they have successfully inserted 14 of the extinct animal's genes into the live DNA of an elephant.

Researchers analysed DNA from mammoths preserved in Arctic permafrost and then used the results to reproduce exact copies of 14 mammoth genes.

These were integrated into the elephant genome, where they functioned as normal DNA.

George Church, professor of genetics at Harvard University, used a new technique known as Crispr that allows scientists to make precision edits to DNA, replacing sections of elephant DNA

British scientists granted permission to genetically modify human embryos

The Francis Crick institute will genetically edit the leftover embryos from from IVF clinics
